Planning and Design Carried Out in Japan

Thorough Proving of Product Design and Production Processes

The basis of our quality assurance activities is the product planning and design that is carried out primarily in Japan in response to market needs and in compliance with ISO9001:14001 standards. Our dedicated professional staff inspect products at every stage of the production process using their years of experience and their high levels of technological expertise.

Quality Control by TOA HQ

TOA production plants both within Japan and overseas are part of TOA Group. Numerous technicians from Japan are sent to our overseas production plants where they use state-of-the-art equipment to produce products under the same stringent quality control system as is used in our production facilities in Japan. Furthermore, twice a year, staff from our Quality Control Division visit overseas production facilities to carry out inspections and ensure that quality standards are being maintained.

For TWP models: Avoid installing the speaker in locations close to the seashore or in indoor swimming facilities that are not well ventilated.
In such locations the bracket may be vulnerable to corrosion, eventually allowing the speaker to fall resulting in personal injury.
Caution on installation: Do not install at places where it is likely to be corroded such as bath room, indoor pools, or seaside.

Installation Locations
- Locations where flammable gas and vapor of flammable liquid are mixed together under the abnormal condition, creating an atmosphere close to the threshold of explosion.
- The TP-M15E/TP-M15D cannot be used in locations that can periodically create an explosive atmosphere when used or operated normally.

Poor Installation Location Examples
1) Locations where vessels are damaged due to corrosion or deterioration, causing explosive gas to escape.
2) Locations which emit explosive gas due to malfunctions, or high temperature or high pressure as a result of irregular reaction.
3) Locations which can create an explosive atmosphere when the ventilation device fails and explosive gas stays.
4) Peripheral areas of or rooms adjacent to locations which can create an explosive atmosphere in a normal state and the explosive gas rarely enters such areas or rooms.

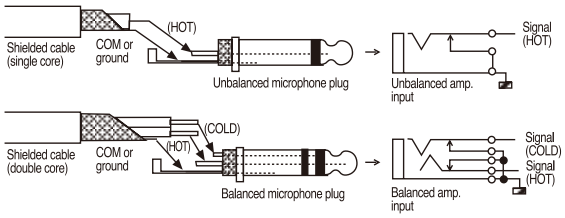
Microphone

Wiring of microphones

Output from a microphone is rather weak; therefore, it is important to use shielded cable for microphones to prevent line noise. The low impedance shielded cable intended for microphones are commercially available. The shielded cable is generally used to transmit the audio signals from microphones (-70dB/0.3mV) or source equipment (0dB/1V).

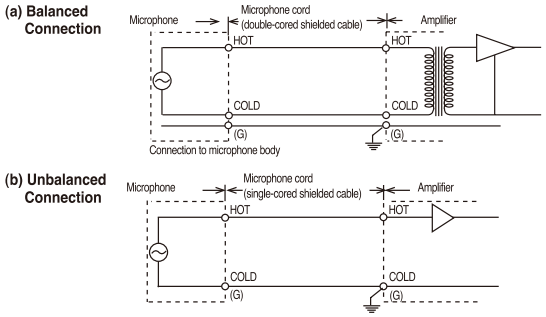
Balanced and unbalanced type



Balanced and unbalanced output

There are two kinds of output from a microphone: balanced and unbalanced. With balanced output, the audio signal appears between the hot (on·going audio signal) and cold (return audio signal), which are both independent of the ground. With unbalanced output, the audio signal appears between the hot and ground (connected to the cold). The connection between balanced output and balanced input (on the amplifier side) is virtually unaffected by external line noise, and it is used for wiring between long distances. Double·cored shielded cable is used for connecting.

balanced output, and single-cored shielded cable is used fo connecting unbalanced output.



Distance of extension for microphone cords

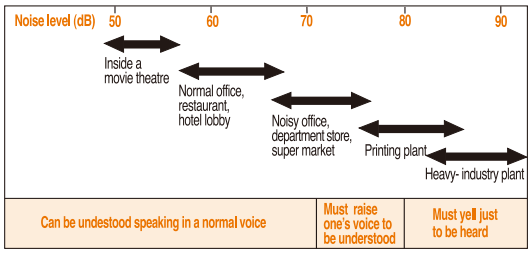
The following table shows the maximum extension distance for microphone cords. when distance extends beyond the following figures, exessive noise will make the microphone impractical,and therefore it will be necessary to use a microphone mixer to boost the signal level to minimize the influence of noise.

Microphone output	Amplifier input	Microphone cord extension distance
Unbalanced	Unbalanced	20m
Balanced	Unbalanced	20m
Balanced	Balanced	80m

Speaker 1

Rough guide for noise levels and audio levels necessary for loudspeaker (for all types of speakers)

Noise levels are expressed in decibels (dB). Below are some typical examples..



When transmitting voice or music through a speaker, it is necessary to transmit at a level that is higher than the ambient noise level. In the case of voice transmission, it should be transmitted at a level 5 to 10 dB higher than the noise level, background music 3 to 5 dB higher, and foreground music 15 to 20 dB higher.

Computation of intensity of sound

As an index to express the intensity of sound from a speaker, sound-pressure level (in dB) is generally used. The sound-pressure level rises as the electric input to the speaker increases, and falls as distance from the speaker increases. This relationship is shown by the following formula:

SPL (dB) = SPL (1W/1m) - Attenuation of SPL due to distance + Amount of increase of SPL due to electric input

The SPL (1W/1 m) indicates the sound pressure level at a point 1 meter away from a speaker when an electric input of 1 W is applied to that speaker. This is used to express comparative speaker efficiency, such as in a catalog.

Attenuation of SPL due to distance
(amount of attenuation = 20 log D D: distance in meters from speaker)

Distance (m)	2	5	10	15	20	30	40	60	80	100
Amount of increase (dB)	6.0	14.0	20.0	23.5	26.0	29.5	32.0	35.6	38.1	40.0

Increase of SPL due to electric input
(amount of increase =10 log W W: electric input)

Electric Input (W)	1	1.5	3	5	6	10	15	20	30	50
Amount of increase (dB)	0	2.6	4.8	7.0	7.8	10	11.8	13	14.8	17

■ **Example of calculation:**

The SPL(1w/1m) of the model SC-615M is shown as 112 dB. The sound-pressure level of this model at distance of 10 meters with an input of 10 W can be calculated as follows according to the above table:

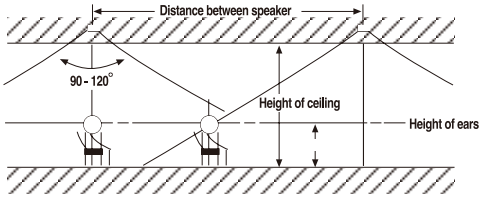
SPL = 112 dB - 20 dB (10m) + 10 dB (10W) = 102 dB

Arrangement of speakers in a general office (Ceiling speakers)

Ceiling-mounted speakers are generally used, and their coverage angle is between 90 and 120 degrees. The smaller the distance between speakers, the better the sound quality and the more even the sound volume. The following table shows the area that can be covered by one speaker.

Speaker 2

Arrangement of speakers

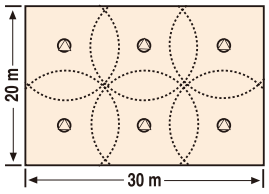


Area of coverage of one speaker

Purpose	Height of ceiling	Distance between speakers	Area of coverage of one speaker
Background music	Less than 2.5m 2.5 - 4.5m 4.5 - 15m	5m 6m 9m	About 25m² About 36m² About 81m²
Announcement		9 to 12m	81 to 144 m²

For general office use not to include background music, speakers should be arranged about 9 to 12 meters apart. Shown below is an example of speaker arrangement in a 30 m x 20 m office with ceiling height of 3 m, which indicates that this office requires about 6 speakers.

Example of arrangement



Office of 30 m x 20 m with 3 m ceiling without music

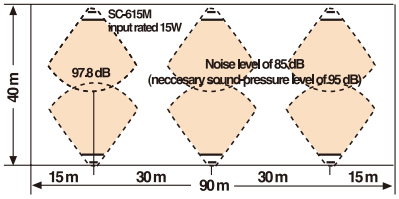
Number of speakers necessary: 6 to 8

Arrangement of speakers in a factory (Horn speakers)

Factories with high noise levels generally use horn speakers, which can produce high levels of sound. If you know where people are working in the factory, speakers are best arranged to cover such locations. If that is unknown, speakers should be arranged in accordance with the floor space.

Here is an example of a 40 m x 90 m room in factory with a noise level af 85 dB. In this factory, SC-615M speakers are installed; therefore, the sound pressure that can be obtained at a point 20 meters away with electric input of 15 W will be:
[112 dB (1W/1m) - 26.0 dB (20 m) + 11.8 dB (15 W)]=97.8 dB

This is a sufficient sound pressure level, 10 dB higher than the noise level. The speakers are installed 20 to 30 meters apart, and 6 speakers can generally cover the area. The sound pressure level near speakers is rather high, so it is necessary to install the speakers at a height of more than 4 meters.



Speaker wiring

For speaker connections, use 600V vinyl (PVC) insulated wire of 1.2mm to 1.6mm in diameter (AWG17 to AWG 14)

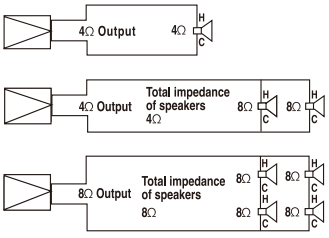
Speaker 3

High-impedance connection and low-impedance connection

The PA amplifiers generally come with low-impedance speaker outputs (indicated as 4 Ω, 8 Ω, 16 Ω, etc) and high-impedance outputs (indicated as 70V, 100V, etc). Low-impedance output is used when a small number of speakers (1 to 4) is used and there is a short distance (10-some meters) between amplifiers and speakers. High-impedance output, is used with a large number of speakers and a longer distance of wiring. Speakers with transformers are used for high-impedance output. For a PA system, high impedance connection should be used if possible, in consideration of wrong speaker connections and transmission efficiency.

■ Example of low-impedance connection:

It is necessary to design the total speaker input impedance to be larger than the amplifier output impedance. When the total speaker impedance is lower than the amplifier output impedance, unstable operation or amplifier malfunction may result. The wiring distance between amplifier and speaker should be less than 10-some meters. If the wiring distance is greater than this, the output power from the amplifier will be consumed as heat in the cables, and not be able to supply the speaker with sufficient power.



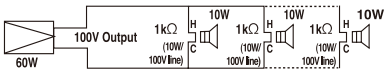
$$4\Omega = \frac{1}{\frac{1}{8\Omega} + \frac{1}{8\Omega}}$$

$$8\Omega = \frac{1}{\frac{1}{8\Omega} + \frac{1}{8\Omega}}$$

■ Example of high-impedance connection:

In a PA system to cover a large area, the wiring distance will be greater, so high impedance connection is used predominantly. In high-impedance connection,all speakers (each with a transformer) will be connected in parallel. Avoid using these speakers together with those without transformers.

In high-impedance connection, as long as you have parallel connection. It will be sufficient to design the total speaker input to be lower than the amplifier output, and this will help eliminate complex impedance calculation.



● Speaker input impedance (10W/100V line)

$$Z = \frac{100\ (V)^2}{10\ (W)} = 1k\Omega$$

● Amplifier output impedance

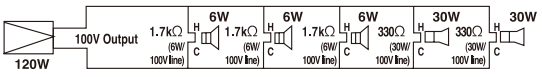
$$Z = \frac{100\ (V)^2}{60\ (W)} = 167\ (\Omega)$$

● Total impedance of speakers

$$Z = \frac{1}{\frac{1}{1\ k(\Omega)} + \frac{1}{1\ k(\Omega)} + \frac{1}{1\ k(\Omega)} + \frac{1}{1\ k(\Omega)} + \frac{1}{1\ k(\Omega)} + \frac{1}{1\ k(\Omega)}} = 167\ (\Omega)$$

Amplifier output 60W = total speaker input (60W)

Even when connecting speakers with different inputs, there will be no problem as long as the total wattage of the speakers does not exceed the amplifier output.



● Amplifier output impedance

$$Z = \frac{100\ (V)^2}{120\ (W)} = 83\ (\Omega)$$

● Total impedance of speakers

$$Z = \frac{1}{\frac{1}{1.7\ k(\Omega)} + \frac{1}{1.7\ k(\Omega)} + \frac{1}{1.7\ k(\Omega)} + \frac{1}{330\ (\Omega)} + \frac{1}{330\ (\Omega)}} = 128\ (\Omega)$$

Amplifier output 120W > total speaker input (78W)

Certifications & Standards

IP Grade Panel

This standard provides a system for classifying the degrees of protection provided by the enclosures of electrical equipment under the International Electrotechnical Commission (IEC) publication 529.

The type of protection covered by this system of classification is as follows.

a) Protection of persons against contact with or approach to live parts and against contact with moving parts inside the enclosure and protection of the equipment against ingress of solid foreign bodies.

b) Protection of the equipment inside the enclosure against harmful ingress of water.

1st Numeral: Protection against solid foreign objects		2nd Numeral: Protection against ingress of water	
0	Non-protected	0	Non-protected
1	Protected against solid foreign objects of 50mm ø and greater.	1	Protected against vertically falling water drops.
2	Protected against solid foreign objects of 12.5mm ø and greater.	2	Protected against vertically falling water drops when enclosure titled up to 15°.
3	Protected against solid foreign objects of 2.5mm ø and greater.	3	Protected against spraying water.
4	Protected against solid foreign objects of 1.0mm ø and greater.	4	 Protected against splashing water.
5	Dust-protected	5	 Protected against water jets.
6	Dust-tight	6	 Protected against powerful water jets.
X	Not tested	7	Protected against the effects of temporary immersion in water.
		8	 Protected against the effects of continuous immersion in water.
		X	Not tested

ISO & European Standards

Certificate No. 21896

* TOA has been granted the "ISO 9001 (BS 575)" registration in the 9000 Series of Quality Assurance Standards by the International Organization for Standardization (ISO).

EN 54 is a standard of the European Union (EU) for fire alarm systems, ensuring high product quality and reliability, and enabling better integration of Voice Alarm (VA) and Public Address (PA). EN 54 plays a significant role in the market for voice evacuation equipment, as the member states of the European Union replace their local standards with the EN 54 standard. All emergency voice evacuation systems marketed in the members states of the European Union are required to be certified to this standard.
